

## CSE 5347/7347 XML

Homework4 : Due Feb: 15 Distance: Feb 18

- Write a PHP program that accepts a year as a parameter and uses XPATH to locate all the CDs published in that year for your cdCatalog2.xml file.
- Return the names of the CDs in a browser.
- You should add some HTML (of your choice) to make the display readable in the browser.

RECOMMEND: Test your XPATH in Oxygen or some other XPATH tester BEFORE you try and implement it in PHP. The trickiest part of the assignment is to get the PHP to work so you want to go into this assignment knowing you have the correct XPATH expression.

Submit to Blackboard – a PDF that contains in order:

- A. Homework 4      Your name
- B. XML in courier font, indented
- C. PHP program
- D. Screen shot of the browser showing the URL of your program and the data returned by the PHP
- E. Links to your XML, and PHP program that is available on a public server.
